Superstore Sales Performance Dashboard

Github: <https://github.com/kandlayasasri/Business-Analytics>

Problem Statement

Management wants to quickly understand sales performance across products, categories, and regions. Create appropriate Power BI visualizations to identify key business patterns.

Steps Followed

Step 1: Dataset Collection

The Sample Superstore dataset was selected from Kaggle and imported into Power BI Desktop.

Step 2: Data Loading

The dataset was loaded into Power BI using the Get Data option.

Step 3: Data Checking

The columns and data types were checked to make sure that fields such as:

- Order Date
- Sales
- Profit
- Quantity
- Region
- Category
- Sub-Category
- Product Name
- State
- Segment
- Ship Mode

were available and suitable for analysis.

Step 4: Creating DAX Measures

Measures were created to calculate important business KPIs such as:

Total Sales = SUM('Sample - Superstore'[Sales])

Total Profit = SUM('Sample - Superstore'[Profit])

Total Orders = DISTINCTCOUNT('Sample - Superstore'[Order ID])

Total Quantity = SUM('Sample - Superstore'[Quantity])

Profit Margin = DIVIDE([Total Profit], [Total Sales], 0)

Step 5: Creating KPI Cards

Cards were created to display:

- Total Sales
- Total Profit
- Total Orders
- Profit Margin

These provide a quick summary of the overall business performance.

Step 6: Creating Sales Trend

A line chart was created using Order Date and Total Sales to understand how sales changed over time.

Step 7: Analysing Regions

A bar chart was created using Region and Total Sales to compare sales performance across different regions.

Step 8: Analysing Categories

A column chart was created using Category and Total Sales to identify which product category generated the highest sales.

Step 9: Analysing Sub-Categories

A bar chart was created using Sub-Category and Total Profit to compare the profitability of different sub-categories.

Step 10: Analysing Products

A Top 10 filter was applied to Product Name based on Total Sales to identify the products contributing the most to sales.

Step 11: Analysing States

A Top 10 filter was applied to State based on Total Sales to identify the strongest-performing states.

Step 12: Adding Slicers

Interactive slicers were added for:

- Region
- Category
- Segment
- Ship Mode

These allow users to filter the dashboard according to their requirements.

Step 13: Dashboard Formatting

The visuals were arranged in a structured layout with consistent titles, spacing, fonts, and formatting to make the dashboard easy to understand

Load Transform Data Cancel

The final output is an interactive Power BI Sales Performance Dashboard.

The dashboard provides:

Visualization	Purpose
Total Sales	Shows overall sales generated
Total Profit	Shows overall profit
Total Orders	Shows number of unique orders
Profit Margin	Shows profitability relative to sales
Sales Trend	Shows sales performance over time
Sales by Region	Compares regional performance
Sales by Category	Identifies high-performing categories
Profit by Sub-Category	Compares profitability
Top 10 Products	Identifies best-selling products
Top 10 States	Identifies high-performing states
Slicers	Allows interactive filtering

The dashboard gives management a single view of the business performance instead of requiring

them to analyse individual records manually.

Conclusion

The Superstore Sales Performance Dashboard was successfully developed using Power BI. The dashboard converts the raw Superstore sales data into meaningful visual information that can be easily understood by management.

The analysis provides an overall view of sales, profit, orders, and profit margin while also allowing detailed analysis of products, categories, sub-categories, regions, and states. The sales trend helps in understanding changes in business performance over time, while the Top 10 analysis helps identify important products and locations.

The interactive slicers make it possible to explore the data based on different regions, categories, customer segments, and shipping modes. Overall, the dashboard makes the sales data easier to analyse and helps management identify strong-performing areas and areas that may require further attention.

Learning Outcomes

After completing this project, I learned:

1. How to import and work with a business dataset in Power BI.
2. How to examine and prepare data before creating visualizations.
3. How to create DAX measures for business calculations.
4. How to calculate important KPIs such as Sales, Profit, Orders, Quantity, and Profit Margin.
5. How to select appropriate Power BI visualizations for different types of analysis.
6. How to analyse products, categories, sub-categories, regions, and states.
7. How to use Top N filters to identify high-performing products and states.
8. How to create interactive slicers for filtering dashboard data.
9. How to arrange and format visuals to create a professional dashboard.
10. How to convert raw business data into meaningful insights for decision-making.
11. I also learned that high sales do not always mean high profitability, so both sales and profit should be considered when evaluating business performance.
